Final Project

Charles,

Unfortunately, I was unable to finish my proposed application, but I really appreciated the project and what I learned because of it. Given the lack of material, I wanted to present a report detailing what went wrong and what went well.

- **PROBLEMS:**
    - It took a lot longer than I expect to populate the dynamic table in the ProjectCreationTableViewController with the create/edit forms.
    - I completed the Service file without too much issue, but after 60 hours of learning and working, I ran up on the deadline and wasn't able to successfully implement a connection between any of the forms and CoreData
    - I imagine the static table for the TicketCreationTableViewController would've been less of a challenge to connect to CoreData, but I needed to be able to create Project entities before that...
    - I never reached the point where I would need to begin researching the topic, but I imagine delegating data between the Page Views in the TicketPageViewController would've taken a large amount of time.

- **POSITIVES:**
    - After working with every type of form object and implementing them in both static and dynamic tables, I feel like I have an awesome grasp on TableViews
    - This class was awesome, and I intend to take it again. While I obviously don't have a knack for mobile development, I've never had as much fun solving problems as I did in this class.
    - I believe that the framework of the application is on point. All I need to do is implement CoreData connections to the different forms and my project would've looked a lot more complete.

Thanks again for a very practical class.
